

PRELIMINARY AMENDMENT  
New National Stage Entry Application of  
PCT/FR2004/001476

**Please add the following new Abstract of the Disclosure:**

A moulding device for the production of containers in thermoplastic material by blowing or blow-drawing, including a mould with two mould halves mutually mobile and provided with a locking device with first and second lock elements, in the form of catches, extending over the whole height of the respective mould halves and a projecting wing on one mould half, including a rotation surface on which a mobile piece is applied over the whole height thereof which includes the second lock element, such that, on blowing, the forces are taken by said mobile piece over the height of the mould by means of the rotation surface.
